Oregon Agricultural Statistics

1982 / 1983

VICTOR ATIYEH
GOVERNOR

OFFICE OF THE GOVERNOR
STATE CAPITOL
SALEM, OREGON 97310

November 8, 1983

Victor Atiyeh
Governor of Oregon

Oregon's agriculture industry is a vital component of our state's economy, providing a wide diversity of quality commodities and food products which reach markets throughout the world.

Along with their production of quality farm products, agriculture producers in our state generate economic benefits in providing employment on and off the farm. Handling, transportation and marketing of agriculture products also provide employment and economic well-being throughout our state.

A close look at some of the valuable data in this publication points out another very significant contribution by Oregon agriculture--a total commitment of some $70.4 million in taxes on farm property and $220 million in salaries during the statistical reporting period.

The data also shows how important Oregon is in comparison to other states of the nation. Our state ranks first in several specialty crops, and in several other production categories, we rank among the top five.

As Governor of Oregon, I am proud of our great achievements in agriculture production, processing and marketing. The data contained in the following pages reinforce that pride.

Sincerely,

Victor Atiyeh
Governor

VA/ss

Oregon Department of Agriculture

635 CAPITOL STREET NE, SALEM, OREGON 97310-0110

Leonard Kunzman
Director
Oregon Department of
Agriculture

November 8, 1983

Agriculture in Oregon is a major resource industry, and its economic importance is truly significant. Dollar values of agriculture products increase dramatically when they enter the processing, handling and marketing sectors. Thus, a raw-value figure of $1.8 billion is multiplied many times over.

The statistics on agriculture production contained in this publication indicate that in the crop year which concluded in 1982, production was abundant--setting records in some instances. Reflected, too, is the continuation of an apparent cycle manifested by generally high production combined with depressed commodity prices. This set of factors continues to affect agriculture throughout the United States.

The comprehensive figures in this publication can tell many stories, and they also serve as a guide to management and policy decisions made by producers, processors, handlers, agriculture support business and government.

As an aid to marketing of agriculture products--an important element if the industry is to prosper--these statistics will prove most beneficial.

Agriculture statistics are a valuable asset to this state's multi-billion-dollar agriculture industry, and for the first time in many years, data related to production and processing of our crops is compiled in one publication.

This publication is the result of a cooperative venture, bringing together the Oregon Department of Agriculture, the U.S. Department of Agriculture Statistical Reporting Service, the College of Agricultural Sciences at Oregon State University and the many farmers and ranchers of Oregon who provide valuable production data.

One other entity which has a key role in Oregon and nationwide in the gathering and publishing of valuable agriculture statistics is the National Association of State Departments of Agriculture (NASDA), which serves in the administrative role for USDA in hiring and supervising some 3,000 part-time enumerators throughout the nation.

Sincerely,

Leonard Kunzman

Leonard Kunzman
Director

FOREWORD

We are pleased to present the 1982-1983 Oregon Agricultural Statistics Bulletin. This publication provides a comprehensive summary of Oregon agriculture and was prepared because of the many requests received from the farming, ranching and agri-business communities. This annual historical publication can be used in conjunction with current crop and livestock reports to provide the accurate information needed for making production and marketing decisions.

The real strength of the Oregon statistical program rests in the fine cooperation of our farmers, ranchers and agri-business people. These voluntary reporters unselfishly give of their time and effort and we extend to them a special "Thank You". Without their cooperation and assistance this publication would not be possible.

The data for this publication was compiled by the Oregon Crop & Livestock Reporting Service and published by the Oregon Department of Agriculture. We wish to thank the Oregon State University Extension Service and their County Agents for supplying much of the county data.

As you use this bulletin, please feel free to suggest any changes you believe would improve its future usefulness.

Sincerely,

Paul M. Williamson

1/ Jan. 1, 1983 Inventory.
2/ Dec. 1, 1982 Inventory.

GENERAL

The value of all 1982 agricultural commodities produced in Oregon, at $1.83 billion, dropped 5 percent from the record high of $1.92 billion established in 1981. The only category showing an increase was berries which registered a 34 percent value gain. The vegetable group posted a 23 percent drop in value, the largest of any commodity group. All other crop groups were virtually the same as the previous year. Livestock and livestock products were down $39 million, 7 percent below the 1981 value of production. However, they still accounted for 31 percent of the total agricultural value, the same as during 1981.

Oregon's importance to the National agricultural production should not be overlooked as the State ranks first or very high in many commodities. Among these are filberts, peppermint, caneberries, hops, pears, cherries, snap beans, sweet corn and onions to mention a few.

SEASON REVIEW - 1982

The 1982 season started out with plenty of moisture, particularly in western Oregon. Record breaking minimum temperatures hit during the first week in January and there was heavy snow in the Cascades and mountains of eastern Oregon. The Willamette Valley and coastal areas were receiving heavy rains. Winter wheat was in fair condition in the west and good to excellent in eastern counties. February was generally colder and a little dryer. Winter wheat was mostly in good condition, although growth was a little behind normal in western Oregon. Heavy rains toward the end of the month along the coast and in the Willamette Valley caused some flooding in the Valley. March brought warmer weather and melting snow. Ranges were in fair to good condition and improved as the month went on. Some spring grains were being planted and seed beds were being prepared for vegetable plantings in the west.

April brought a considerable amount of moisture over the State from heavy rains in coastal areas to snow in the Cascades. Some early growth was beginning to show in alfalfa but growth of all crops was rather slow. Seeding of spring grains was nearing completion during the first week. Warmer weather occurred toward the end of the month which helped most crops in growth and development. Favorable weather continued into May. Range and pastures were responding to warmer temperatures but growth was still behind normal. Winter wheat continued to be fair to good although considerably behind normal at the start, but progressed rapidly during the month. Moisture was rather short during the month. By the end of May, some crops were beginning to show stress. The first part of June brought some limited relief to the dry conditions but most grains, particularly spring planted crops, continued to show moisture stress. Strawberry harvest was underway and continued throughout the month. Haying continued with the first crop completed and some second cutting started. Cherry harvest started in Wasco County by the third week and in the Willamette Valley by the end of the month.

July started out with some much needed precipitation but the rains interrupted haying operations. Harvesting of winter wheat started about mid month. Barley harvest was winding down about the third week while oat harvest was just getting started. Cherry picking continued the first half of July and was over by the third week. The peach harvest got underway toward the end of July. Warm dry weather in August permitted rapid harvest of winter wheat and by the end of the month the harvest was about over; a little ahead of normal. Apple harvest was underway and Bartlett pear harvest started about the third week. Peach harvest continued throughout the month. Harvesting of cannery crops was in full swing but cannery stocks were causing problems to growers. September brought some much needed rains to most areas improving pastures and aiding fall tillage conditions. Bartlett pear harvest was about finished by the second week and winter pears were underway by mid month. Peach harvest was about over.

October rains caused some delay in later small grain harvest and interrupted fall seedings somewhat. Seeding was nearly completed by the end of the month. Tree fruit harvest finished up in November and harvesting of potatoes was in its final stages. November was mostly cool and wet, slowing growth of late seeded small grains and limiting pasture growth. Fruit trees were going into dormancy. Winter ranges and pastures were in good shape. December brought heavy rains causing severe flooding in some coastal areas and Willamette Valley basins. Winter wheat condition was mostly good and emergence was about normal. Some pruning of fruit trees was being done. Hay supplies were getting rather tight.

FIELD CROPS

Soil moisture conditions for seeding winter grains in the fall of 1981 started out on the dry side. Welcome rains finally arrived toward the end of September and continued into October improving soil conditions for fall planting. Emergence of winter wheat was good, but some reseeding was necessary in the Columbia Basin because of heavy infestations of cheatgrass. Some fields were beginning to show moisture stress by mid-June, particularly in eastern Oregon as a result of dry weather. Planting of spring grains started about the first part of April. Early growth and development were lagging because of cool, wet weather, but picked up as weather improved.

Fewer acres for harvest and lower average winter wheat yield reduced wheat production 17 percent from the 1981 record crop. Spring wheat production was down 4 percent from 1981 despite a record yield of 40.0 bushels per acre. Acres of spring wheat for harvest was the smallest in five years.

Barley production was 20 percent greater than in 1981 and the largest crop since 1971. Acres harvested was the largest in the past nine years and yields averaged a near record 64.0 bushels per acre. Record yields and the largest acreage since 1971 brought oat production to 6.75 million bushels, largest production since 1972. Oregon's oat yield was the highest State average in the Nation. Corn for grain production and average yields were both record highs. Silage production was down due to fewer acres harvested.

Sugar beet acreage and yields were lower, bringing production down 16 percent. Fall potato production was down 3 percent, ranking 5th in the Nation. All hay production was up 3 percent. Both acreage and yield were up. Second to Washington in production, hops had the highest production since 1952. Peppermint acreage was the lowest in 15 years and the average price was the lowest in 9 years. Oregon produces over half of the United States peppermint crop.

VALUE OF PRODUCTION: PERCENT OF TOTAL, BY FIELD CROPS, OREGON, 1982

FRUIT AND NUTS

Filbert production in Oregon hit an all-time high in 1982. More producing trees, a good set, and ideal harvesting conditions were contributing factors. The price per ton, however, is estimated to be the lowest in 6 years, largely due to foreign competition and increased production. Oregon produces nearly all the domestically grown filberts.

Fruit production on the other hand was generally lower in 1982 than in 1981. Sweet cherry production was off nearly 13 percent from 1981, mainly due to the short crop in the Willamette Valley. But, unlike the previous two years, the fruit quality was much better since the crop was not largely affected by late rains. Nearly twice as many cherries were fresh packed in 1982 compared with 1981. Oregon again ranked second nationally in sweet cherry production, producing nearly one-fourth of the total production.

Pears, the leading fruit produced in Oregon, were down substantially from previous years, for both Bartletts and Winter Pears. Oregon ranks third in pear production in the U.S., producing nearly one-fourth of the U.S. total.

Apple production in 1982 was down slightly from a somewhat dismal year in 1981. Poor set and small size attributed to the lower production.

Plum and prune production was above normal but below the 1981 crop. Marketing was the biggest problem in 1982 with nearly a fourth of the crop estimated to have been left in the field to rot. Price improvements in 1982 were virtually all due to marketing of fresh plums.

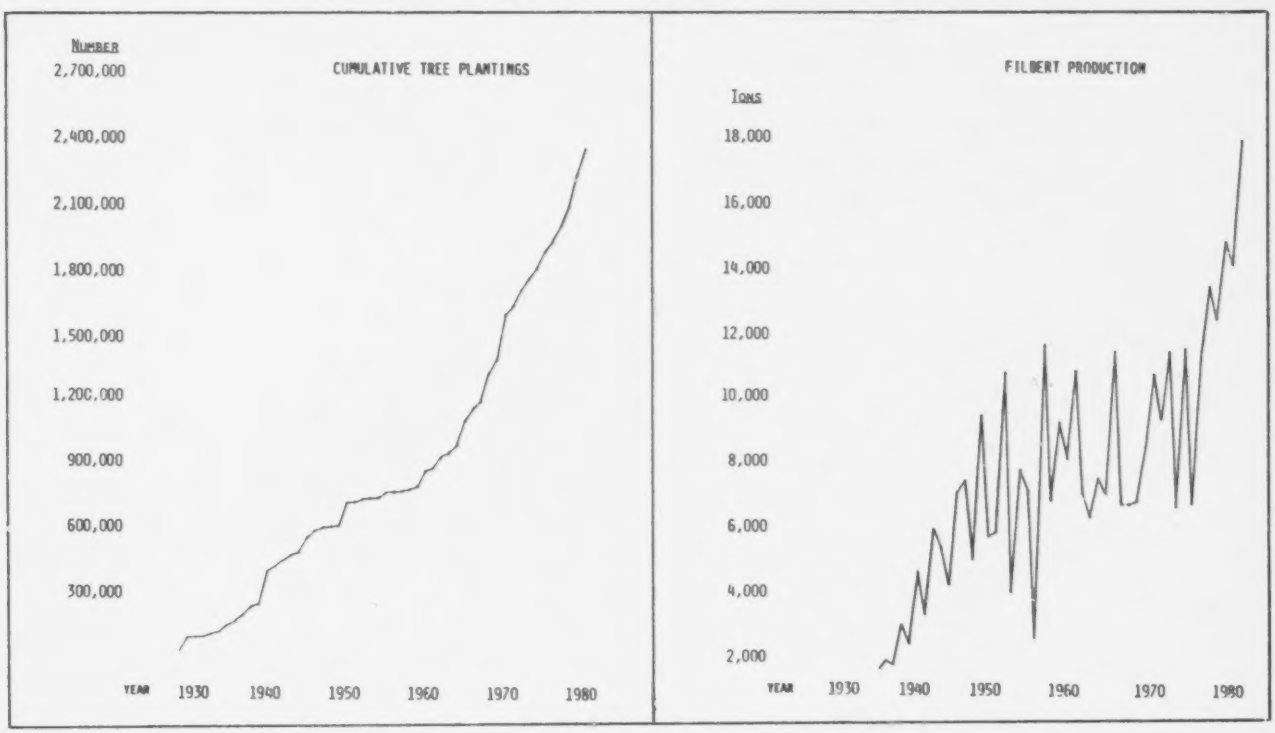
FILBERTS: Tree Plantings and Production, Oregon, 1930-1982



VEGETABLES

Fresh Market and Dual Purpose

Production of fresh market and dual purpose vegetables was up substantially from 1981-accounting for 37 percent of the total Oregon vegetable production. Acres harvested was up on all crops and yields were up for sweet corn, broccoli and cauliflower. Onion and carrot yields were down. Value per hundredweight was down for all vegetable crops except broccoli. Oregon continues in seventh place for production of fresh market vegetables and eighth in total value.

Processing

Sweet corn production for 1982 increased from the previous year and continued to lead other processing crops. Acres harvested and average yields for sweet corn were both up substantially from 1981. Increases in value per ton also helped to raise sweet corn's share of the market value of all vegetables for 1982. Production of snap beans and green peas for processing declined. Harvested acres were down for snap beans and up for green peas while yields were down for both crops. Oregon ranked fifth in the Nation in total production and value of processing vegetables during 1982.

BERRIES

Prices for Oregon berry crops in 1982 were much improved from 1981, especially for strawberries, red raspberries, and loganberries. The only crops for which the value of utilized production did not increase were black raspberries and cranberries. In their cases, significant drops in production more than offset higher prices per pound received. Production for the other berry crops increased or remained the same as last year.

The strawberry picking season started on a "dry" note, but record yields put production at its highest level since 1971. In spite of the large crop, strong demand gave growers their best price ever.

Red raspberry yields were down due to winter kill and disease problems, but increased acreage upped production to where it hadn't been since 1967. Average price received per pound was the second best on record, only exceeded by the record 74.6 cents per pound set in 1978. Black raspberry prices haven't been this low since 1970-71. Value of utilized production was the smallest since 1945. Blackberry production and prices were up slightly in 1982 but the market still remained depressed. Evergreen blackberry prices continued below the 20 cents per pound level for the third straight year as many berries were left in the fields.

Blueberry production was unchanged from a year ago as increased acreage balanced the effect of lower yields with prices remaining strong.

Poor bloom and pollination conditions, along with excessive vegetative growth, contributed to the smallest cranberry crop since 1970. A record average price could not completely offset the lower production.

LIVESTOCK

Approximately 31 percent of Oregon's agricultural income comes from the production of livestock and livestock products. In 1982 the value of production for all livestock, dairy and poultry was nearly 565 million dollars--the same as in 1980, but down 7 percent from 1981! The fall in production value was due primarily to a drop in prices for cattle and calves, which generates about half the livestock value of production each year. The average price received per hundredweight for all cattle and calves in 1982 was 8 percent below a year earlier.

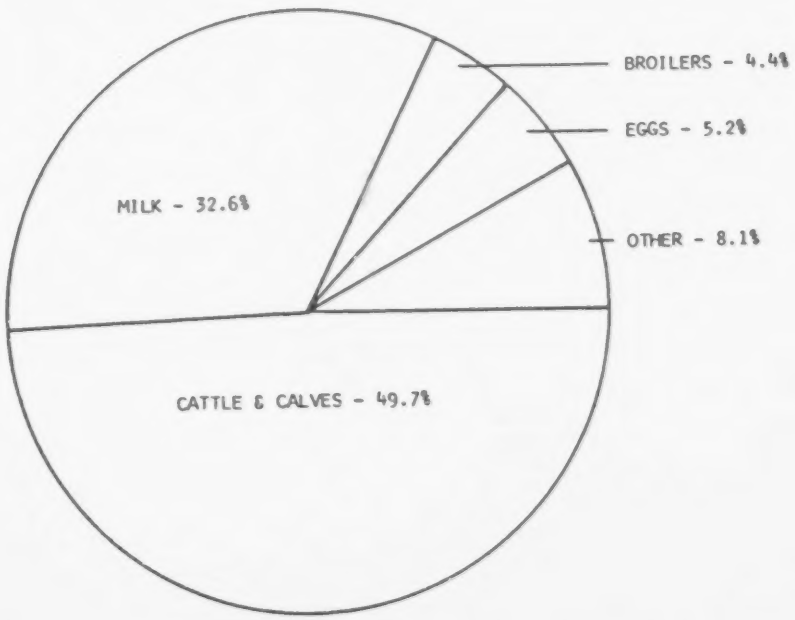
Oregon's dairy industry was one of the two livestock species showing an increase in value of production in 1982. With cow numbers up and a record amount of milk per cow, milk production increased 7 percent from a year ago. Average prices for milk and cream sold were only four and three cents less than they were in 1981.

The other livestock species showing an increase in value of production was hogs and pigs. With pounds produced only slightly less and price per cwt. up $9.50, the value of production increased 20 percent.

Egg production in 1982 totaled 620 million eggs, 45 million less than in 1981. With a lower production and an average two cent price drop; the value of production declined 10 percent. Broiler production declined by over two million birds in 1982.

Sheep and lamb numbers declined 7 percent in 1982 to half a million head on January 1, 1983. Wool production dropped 13 percent as wool prices plummeted 39 percent to 50 cents per pound in 1982.

VALUE OF PRODUCTION: PERCENT OF TOTAL, BY LIVESTOCK GROUPS, Oregon, 1982



VALUE OF PRODUCTION: Livestock, Dairy and Poultry, Oregon, 1980-82 1/
